Surrogacy

## EGG DONOR CATALOGS

IVF (in vitro fertilisation) involves retrieving eggs from a woman's ovaries and fertilising these in the laboratory with sperm from either her partner or a donor to create embryos which are replaced back into her womb to develop as a

normal pregnancy. The journey through an IVF treatment can seem quite a daunting process, so we are here to help support you through every step, ensuring that you feel happy that the treatment is the right way forward for you.
